

AI BRAIN TUMOR DETECTION CENTER

Report ID: 2bcc1356-3b53-4777-a0e4-d93727106ade
Date: 2026-06-15 14:03:58.158921

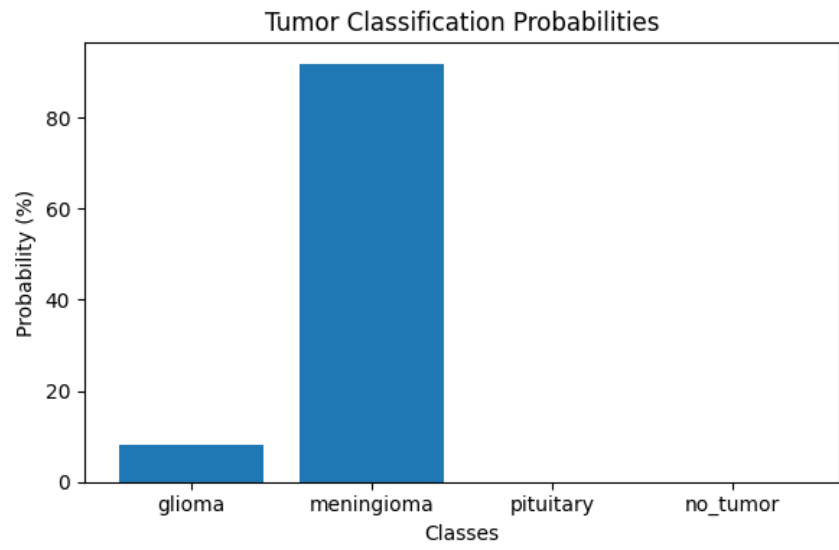

Patient Name	harsha
Age	21
Email	fdjjiejrgjr
Tumor Type	meningioma
Confidence	91.86%

AI SUMMARY

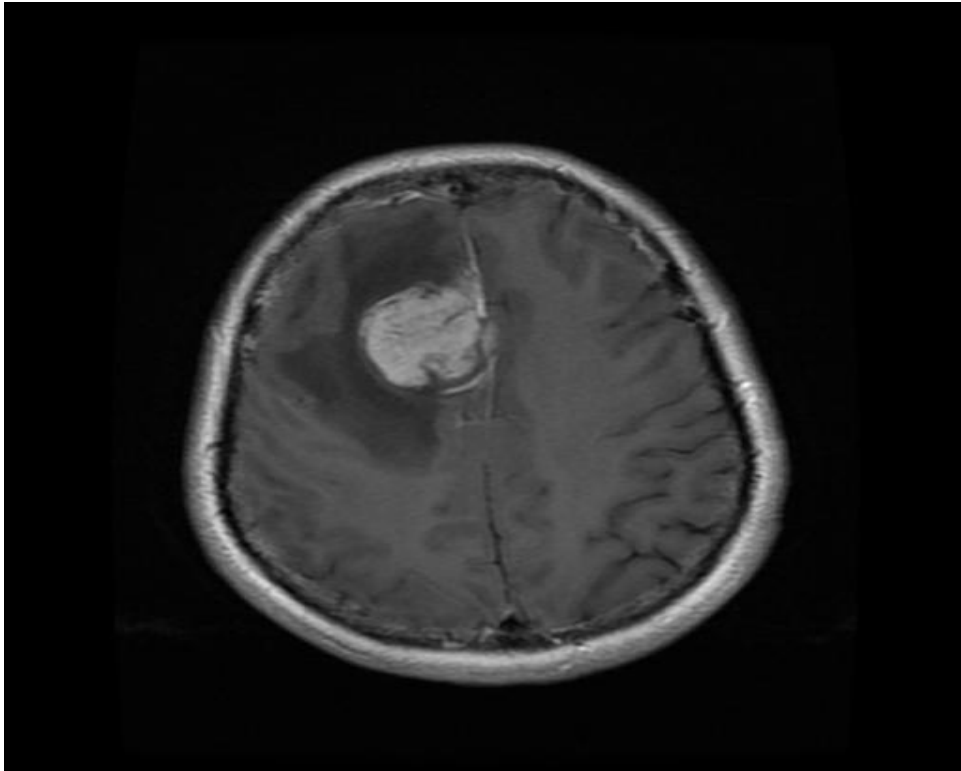

Based on the Brain MRI classification: 1. **Tumor Explanation:** The classification suggests a **meningioma**. This is a common type of primary brain tumor originating from the meninges, the protective membranes surrounding the brain and spinal cord. Meningiomas are typically benign (non-cancerous) and often slow-growing. 2. **Possible Symptoms:** Symptoms can vary widely depending on the tumor's size and location. They may include headaches, seizures, vision changes, hearing loss, weakness or numbness on one side of the body, personality changes, or other neurological deficits due to pressure on adjacent brain tissue. 3. **Clinical Recommendations:** Given the high confidence, a comprehensive neurosurgical evaluation is strongly recommended. This should include a review of all imaging, potential advanced MRI sequences, and discussion of management options such as continued monitoring or surgical intervention. Definitive diagnosis requires histopathological examination. 4. **Patient-Friendly Summary:** Your MRI results indicate a high likelihood of a meningioma, which is usually a non-cancerous brain tumor. While symptoms vary, it's important to consult with a neurosurgeon to review your specific situation and discuss the best next steps, which could involve further monitoring or treatment.

Probability Distribution

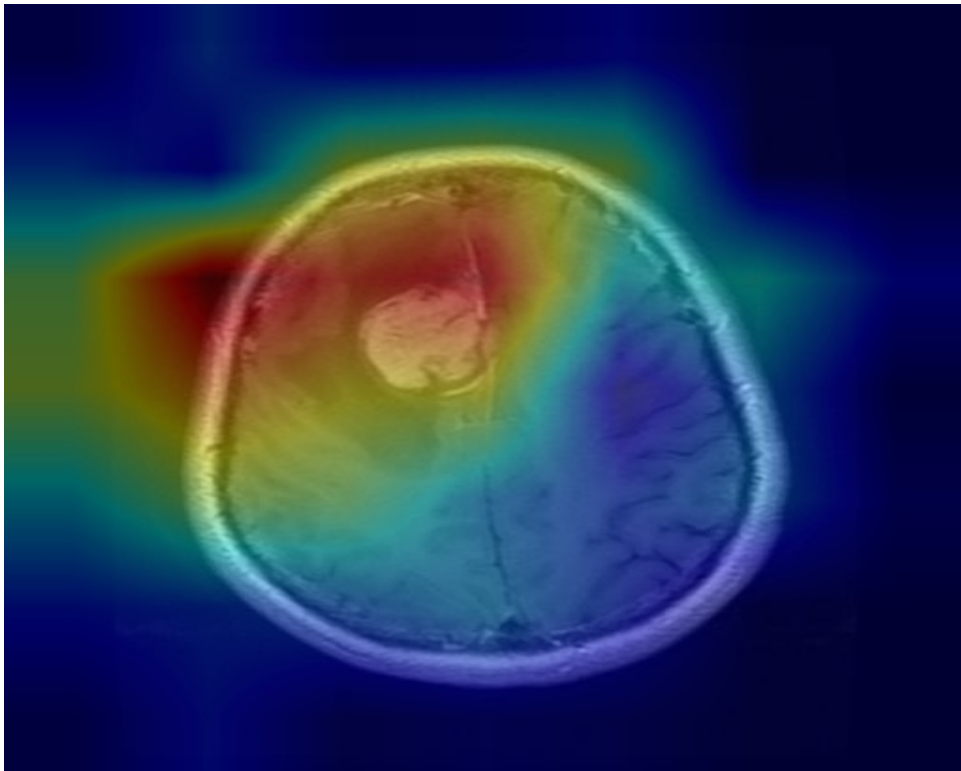

Class	Probability (%)
glioma	8.13
meningioma	91.86
pituitary	0.0
no_tumor	0.0

Clinical Recommendation

Based on the AI analysis, the predicted class is **meningioma**. Further consultation with a neurologist/radiologist is recommended. Clinical correlation and additional investigations may be required.
