

AI BRAIN TUMOR DETECTION CENTER

Report ID: 43397fd4-eb3b-4d62-90fd-5b6ae0f4c5ed
Date: 2026-06-15 13:40:40.563769

Patient Name	harsha
Age	21
Email	manubattineni@gmail.com
Tumor Type	meningioma
Confidence	78.06%

AI SUMMARY

Based on the brain MRI classification, the AI model suggests a **meningioma** with 78.06% confidence.

1. **Tumor Explanation:** A meningioma is a common type of primary brain tumor originating from the meninges, the protective membranes surrounding the brain and spinal cord. They are typically benign (non-cancerous) and slow-growing.

2. **Possible Symptoms:** Depending on its size and location, a meningioma can cause symptoms such as headaches, seizures, vision changes, hearing loss, weakness or numbness in limbs, or cognitive changes, due to pressure on adjacent brain tissue.

3. **Clinical Recommendations:** Consultation with a neurosurgeon or neurologist is recommended for further evaluation. This will involve reviewing the imaging in detail, correlating with your clinical symptoms, and discussing potential management options, which may include watchful waiting, surgical removal, or radiation therapy.

4. **Patient-Friendly Summary:** The MRI indicates a growth called a meningioma, which is usually a non-cancerous, slow-growing tumor from the brain's protective lining. Symptoms can vary, but it's important to see a brain specialist to discuss these findings, understand your specific situation, and determine the best next steps for you.

Probability Distribution

Class	Probability (%)
glioma	20.83
meningioma	78.06
pituitary	0.0
no_tumor	1.11

Clinical Recommendation

Based on the AI analysis, the predicted class is **meningioma**. Further consultation with a neurologist/radiologist is recommended. Clinical correlation and additional investigations may be required.
