

AI BRAIN TUMOR DETECTION CENTER

Report ID: 571aa951-d4f8-460d-9d21-dfe8b9d58068
Date: 2026-06-15 14:41:34.508158

Patient Name	harsha
Age	20
Email	yuegsgqs
Tumor Type	meningioma
Confidence	91.86%

AI SUMMARY

Based on the brain MRI classification: 1. **Tumor Explanation:** The analysis indicates a meningioma, a common type of primary brain tumor originating from the meninges, the protective membranes surrounding the brain and spinal cord. Most meningiomas are benign (non-cancerous) and slow-growing, though some can be atypical or malignant. 2. **Possible Symptoms:** Symptoms depend on the tumor's size and location. Common signs may include headaches, seizures, vision changes, hearing loss, weakness or numbness in limbs, and other focal neurological deficits. 3. **Clinical Recommendations:** Consultation with a neurologist and/or neurosurgeon is strongly recommended for a comprehensive evaluation. Further steps may include a detailed neurological exam, repeat MRI with contrast, and potential surgical biopsy for definitive pathological diagnosis and grading. Treatment options, such as observation, surgery, or radiation, will be discussed based on the overall clinical picture. 4. **Patient-Friendly Summary:** The AI detected a meningioma, a growth usually found on the brain's outer covering, often benign and slow-growing. You might experience symptoms like headaches or changes in vision. It's vital to see a doctor, such as a neurologist or neurosurgeon, to fully evaluate this finding and determine the best course of action. This AI result is not a final diagnosis.

Probability Distribution

Class	Probability (%)
glioma	8.13
meningioma	91.86
pituitary	0.0
no_tumor	0.0

Clinical Recommendation

Based on the AI analysis, the predicted class is **meningioma**. Further consultation with a neurologist/radiologist is recommended. Clinical correlation and additional investigations may be required.
