

AI BRAIN TUMOR DETECTION CENTER

Report ID: 979ee3b6-c873-410f-8690-5cf1526ad08e

Date: 2026-06-15 14:42:24.536242

Patient Name	manudeep
Age	20
Email	manubattineni@gmail.com
Tumor Type	meningioma
Confidence	91.86%

AI SUMMARY

Based on the MRI classification, a **meningioma** is suggested with high confidence. 1. **Tumor Explanation:** Meningiomas are typically slow-growing tumors that arise from the meninges, the protective membranes surrounding the brain and spinal cord. They are usually benign (non-cancerous) but can cause symptoms by pressing on the brain. 2. **Possible Symptoms:** Symptoms depend on the tumor's size and location, and may include headaches, seizures, weakness or numbness in limbs, vision changes, hearing loss, or cognitive difficulties. Many meningiomas are found incidentally without causing symptoms. 3. **Clinical Recommendations:** Consultation with a neurosurgeon or neurologist is highly recommended for further evaluation. This may involve a detailed neurological exam, repeat imaging for growth monitoring, and discussion of management options such as observation, surgery, or radiation therapy. 4. **Patient-Friendly Summary:** Your MRI suggests a common, usually non-cancerous brain growth called a meningioma. While often slow-growing, it's important to consult with a brain specialist (neurosurgeon or neurologist) to understand its significance for you and discuss the best next steps. This is not a final diagnosis.

Probability Distribution

Class	Probability (%)
glioma	8.13
meningioma	91.86
pituitary	0.0
no_tumor	0.0

Clinical Recommendation

Based on the AI analysis, the predicted class is **meningioma**. Further consultation with a neurologist/radiologist is recommended. Clinical correlation and additional investigations may be required.
