

AI BRAIN TUMOR DETECTION CENTER

Report ID: a567e6a1-833b-49f8-b6aa-6da8f00be160
Date: 2026-06-15 14:03:42.176624

Patient Name	harsha
Age	21
Email	fdjjiejrgjr
Tumor Type	meningioma
Confidence	91.86%

AI SUMMARY

Based on the Brain MRI classification, a meningioma is indicated with 91.86% confidence. 1. ****Tumor Explanation:**** A meningioma is a common type of primary brain tumor originating from the meninges, the protective membranes surrounding the brain and spinal cord. They are typically slow-growing and often benign (non-cancerous), though their size and location can cause significant symptoms. 2. ****Possible Symptoms:**** Symptoms vary based on the tumor's size and location, and often develop gradually. They may include headaches, seizures, vision changes, weakness or numbness in limbs, personality changes, or issues with balance and coordination. 3. ****Clinical Recommendations:**** Further clinical evaluation is recommended, including a comprehensive neurological assessment. Review of the full MRI sequence by a neuroradiologist and consultation with neurosurgery or neuro-oncology is crucial to discuss the implications, prognosis, and potential management strategies, which may range from watchful waiting to surgical intervention or radiation therapy. 4. ****Patient-Friendly Summary:**** Your MRI results suggest a type of brain growth called a meningioma, which is usually slow-growing and non-cancerous. It's important to discuss these findings with your doctor, who will explain what this means for you and outline the next steps, which might involve more tests or seeing a specialist.

Probability Distribution

Class	Probability (%)
glioma	8.13
meningioma	91.86
pituitary	0.0
no_tumor	0.0
