

AI BRAIN TUMOR DETECTION CENTER

Report ID: c4b2181a-984c-4e01-8263-6273e1541d65
Date: 2026-06-15 13:29:21.090752

Patient Name	harsha
Age	21
Email	darahasa9652@gmail.com
Tumor Type	meningioma
Confidence	91.86%

AI SUMMARY

Based on the Brain MRI classification, a **meningioma** is suggested with 91.86% confidence. 1. **Tumor Explanation:** Meningiomas are typically slow-growing tumors originating from the meninges, the membranes surrounding the brain and spinal cord. They are often benign (non-cancerous) but can sometimes be atypical. Their growth can compress adjacent brain tissue. 2. **Possible Symptoms:** Symptoms vary widely depending on the tumor's size and location. Common manifestations include headaches, seizures, focal neurological deficits (e.g., weakness, numbness, vision changes), or cognitive/personality alterations. 3. **Clinical Recommendations:** Consultation with a neurologist and a neurosurgeon is highly recommended for comprehensive evaluation. Further diagnostic steps, potentially including additional imaging (e.g., higher-resolution MRI with contrast, CT) and ultimately histopathological analysis (biopsy), are crucial for definitive diagnosis and treatment planning. 4. **Patient-Friendly Summary:** Your MRI scan suggests a growth called a meningioma, with good confidence. These are usually non-cancerous growths from the brain's lining. Symptoms might include headaches or seizures. It's important to see a brain specialist (neurologist/neurosurgeon) to discuss these findings, confirm the growth type, and plan any necessary next steps. This AI finding is not a final diagnosis.

Probability Distribution

Class	Probability (%)
glioma	8.13
meningioma	91.86
pituitary	0.0
no_tumor	0.0

Clinical Recommendation

Based on the AI analysis, the predicted class is **meningioma**. Further consultation with a neurologist/radiologist is recommended. Clinical correlation and additional investigations may be required.
